Scenario:
You are a student at the University of South Carolina and have a jam packed schedule. While walking home from the gym, you find yourself parched! You forgot to refill your water bottle before you left. You want to use an application to find where there is water for you to fill up your water bottle.

Task 1: Open the app and type in your location of "Blatt Fitness Center". Select which station that is nearest to you.

Task 2: Rate the station you navigated to out of five stars, and give a synopsis of your experience (for example, clean and cold water, not very busy)

Task 3: You had such a good time using this app that you are now inspired. Set your goal for how many water bottles you'll save this month.

Notes
What changes you should make to your application (min 3 things)
- Create a homescreen with more options, not just navigation.
- Change the name of the app, as it already exists as an app.
- Show the ratings of each station on the map.

What you need to keep the same for your application (min 3 things)
- Keep the exit button while navigating to a station.
- Keep the tasks bar at the bottom on every page.
- Keep the ability to "like" your favorite water stations.
